

## IDENTITY AND ACCESS MANAGEMENT

The combination of regulatory diversity, the changing technology landscape and the explosion of data exploitation has created a situation whereby access management has become less controlled than is desired, often falling below legal standards.

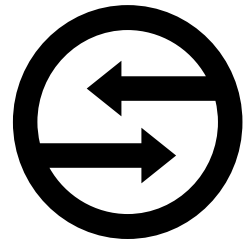

Organisations have found that they only understand their data landscape on a micro/siloed level, with no one person able to answer simple questions about data use, this is true even for reasonably new and small companies. There is a large problem where the lineage and use of data is not known at a higher level and cannot be linked to any obligation and access rights without specific knowledge. There is no ability to reuse.

All of this inevitably leads to increase in internal controls and staff which are often difficult to use and have the consequence of adding a barrier to entry for projects due to their complexity, they are also expensive to control. The added obstacle is that interpretation is not uniform, staff have varying levels of experience and can apply 'rules' with differently.

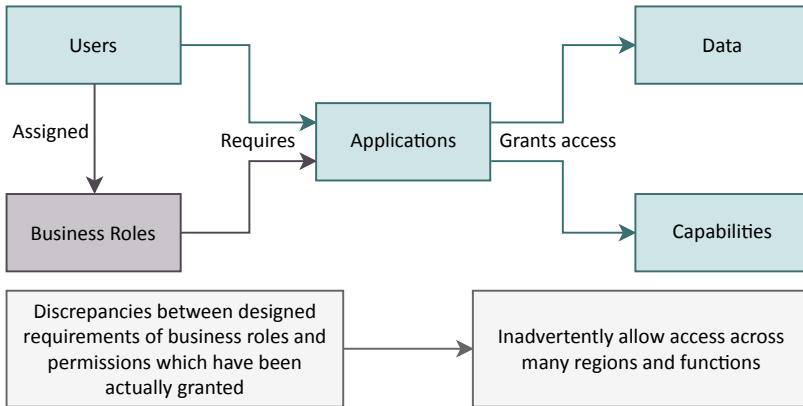

## MODERN DATA LINEAGE

Solidatus is a specialised, powerful and modern data lineage tool. The simple, intuitive and flexible web-based application allows organisations to rapidly discover, visualise and understand how data flows through their systems.

Whether used to demonstrate regulatory lineage, improve governance, assist with transformational change or reduce inefficiencies in data handling, Solidatus is uniquely engineered to build end-to-end data models more efficiently and effectively.

## Monitoring, planning and debugging user entitlement lineage to detect movers, leavers and stale permissions

### Solidatus for the business

- Accelerated data discovery: Automation & Collaboration
- Immediate ROI: Rapid deployment & adoption
- Increase Understanding: Data-driven business insight
- Standardisation & Optimisation: Improve efficiency & reduce costs
- Simple & intuitive: Business focused, available to all
- Improved agility: Quickly & easily adapt to internal & external influences
- Reduce risk: Historic, Current and Future state
- Socialisation of data

## MODERN DATA LINEAGE

Solidatus is intuitively designed to help an organisation to rapidly build a complete front to back data flow through collaborative knowledge sharing within one centrally managed solution and map out the entire data landscape.
